Modules
for Higher Education

Cascade CMS is one of the most flexible content management systems on the market.

You can use Cascade CMS to develop your own modules, or let our Professional Services Team build out the functionality for you. Even better, you can download numerous modules at **no additional charge** and customize them to meet your needs. Some of the most popular modules include:

Course Catalog

The course catalog module provides a way to create courses once and publish them to web servers, databases, and other systems.

The module also allows you to manage a course catalog with landing pages, individual course pages, automatically-generated PDF documents, basic search, or your own custom functionality.

This module is built on Bootstrap to exhibit responsive web design capabilities.

Faculty Directory

The faculty directory module makes it easy for non-technical users to update their information and bios using customizable content entry fields.

Each profile page includes a biography, head shot, contact information, and more. The landing page automatically populates a directory table that is sortable by department.

This module is also built on Bootstrap to exhibit responsive web design capabilities.

Social Media Mashup

Are you looking to implement more 'create once, publish everywhere' functionality by pulling content from your social media accounts into your website? With social media mashup, you can combine your social media content into one stream that's displayed on an easy-to-digest page.

This module contains examples of integrating cross-site news sharing and calendar events from other Cascade CMS sites.
